

Features and Benefits for the Veterinarian using

Precision is what CryoPen® is all about, working with pinpoint accuracy, control of temperature and control of depth.

As a Veterinarian you are constantly freezing at 55 bar of pressure at a temperature of -89 degrees Celsius, the pressure allows for a penetration rate of 5 seconds per millimetre. Now you are entering the lesions and rupturing the unwanted cells thus obtaining the effective cryonecrosis achieving the required results with a short, safe and painless treatment.

Geriatric patients can now receive treatments which would normally have a huge risk associated with surgical procedures. No local or general anaesthetic is required, sedation in certain cases is effective enough to perform treatments.

Affordable and risk-free treatments can now be a part of your practice, adding value to your patient's comfortability and enabling owners who would normally not be able to afford surgical procedures to have their animals treated.

No hospital stay overs for the animals and they go home with their owners straight after the consultation. Lesions such as squamous cell carcinoma, papilloma, sarcoids, warts, skin tags, perianal adenoma, epulis etc. can now be removed non surgically. In the avian veterinarian practice bumblefoot can also be treated with this innovative instrument effectively.

Patients treated with Cryopen do not need aftercare due to the application being non-invasive. These lesions have no sutures, this means no risk of tearing or infection.

See videos of Cryopen on either www.seremed.com or www.ho-equipments.com
